CRICKET PLAYER PERFORMANCE TRACKING APPLICATION

ABSTRACT

The Cricket Player Performance Tracking Application is a digital system designed to monitor, analyze, and manage the performance of cricket players using modern technology. Cricket is one of the most popular sports, and evaluating player performance accurately is very important for coaches, teams, and selectors. This application provides a simple and efficient platform to record and track the statistical data of players during matches and practice sessions.

The main objective of this project is to develop a user-friendly application that stores player information and calculates performance metrics such as runs scored, strike rate, batting average, wickets taken, bowling economy rate, and fielding statistics. The system allows coaches or administrators to enter match data, view player statistics, and analyze improvements over time. By using this application, teams can easily identify strong and weak areas of players and make better decisions in team selection and training.

The application uses modern software technologies to manage and process cricket data efficiently. It provides features such as player profile management, match performance recording, statistical reports, and graphical analysis. The stored data can be accessed anytime, which helps in maintaining historical performance records of players.

This system reduces manual record keeping and improves accuracy in performance evaluation. It also helps young and professional players understand their progress and work on improving their skills. The Cricket Player Performance Tracking Application is a useful tool for cricket academies, schools, and sports organizations to enhance player development through data-driven insights.

In conclusion, this project demonstrates how technology can be effectively used in sports analytics to monitor and improve cricket player performance, making training and evaluation more systematic and efficient.

INTRODUCTION

Cricket is one of the most popular and widely played sports in the world. It is enjoyed by people of all ages and is played at various levels such as school, college, club, national, and international competitions. In cricket, the performance of each player plays a very important role in the success of a team. Therefore, analyzing and monitoring player performance is essential for improving skills, planning strategies, and selecting the best players for matches.

In traditional cricket management, player performance details are usually recorded manually using notebooks, score sheets, or spreadsheets. This method requires a lot of time and effort, and there is a high possibility of calculation mistakes or data loss. It also becomes difficult to analyze a player's performance over a long period of time because the information is scattered and not organized properly. With the growth of technology, digital solutions have become very useful for solving such problems in sports management.

The Cricket Player Performance Tracking Application is designed to provide an efficient and reliable system for recording and analyzing cricket player statistics. This application helps store detailed information about players, matches, and performance records in a centralized database. It allows coaches, team managers, and sports analysts to easily enter match details and automatically generate performance statistics.

The system records important batting, bowling, and fielding statistics such as runs scored, balls faced, strike rate, batting average, number of wickets taken, overs bowled, bowling economy rate, catches, and run-outs. By analyzing these statistics, coaches and trainers can understand the strengths and weaknesses of each player and provide proper guidance for improvement.

Another important advantage of this application is that it provides quick access to historical data. Users can review previous match performances, compare player statistics, and identify trends in performance over time. This helps in making better decisions related to team selection, player training, and match strategies.

The application also helps young and developing players to track their progress and evaluate their improvement regularly. By viewing their performance reports and statistics, players can identify areas where they need to improve, such as batting technique, bowling accuracy, or fielding skills.

PROBLEM STATEMENT

Cricket player performance analysis is very important for improving individual skills and overall team performance. In many cricket academies, schools, and local teams, player statistics such as runs scored, wickets taken, strike rate, and bowling economy are still recorded manually using score sheets or basic spreadsheets. This traditional method creates several problems in managing and analyzing player performance effectively.

One of the major problems is the **lack of a centralized system** to store and manage player performance data. Manual record keeping makes it difficult to organize large amounts of data, and there is a high chance of data loss or calculation errors. Coaches and team managers may find it challenging to track the progress of players over multiple matches or training sessions.

Another problem is the **difficulty in analyzing performance data**. When records are stored manually, it becomes time-consuming to calculate important statistics such as batting average, strike rate, bowling economy rate, and overall player rankings. As a result, coaches may not get accurate insights into a player's strengths and weaknesses.

Additionally, there is **limited access to historical performance data**. Without a proper digital system, comparing a player's performance across different matches or seasons becomes complicated. This lack of structured analysis affects decision-making in areas such as team selection, training plans, and player development.

Furthermore, manual systems do not provide **visual reports or performance trends**, which are useful for understanding how a player improves over time. Players themselves may also find it difficult to evaluate their own progress and identify the areas where they need improvement.

To address these issues, there is a need for a **Cricket Player Performance Tracking Application** that can store player data digitally, automatically calculate statistics, generate performance reports, and provide an easy way to analyze player performance. Such a system will help coaches, managers, and players make better decisions and improve overall cricket performance through data-driven insights.

PROPOSED SOLUTION

To overcome the limitations of manual record keeping and performance analysis in cricket, a Cricket Player Performance Tracking Application is proposed. This system is designed to provide a digital platform for recording, storing, and analyzing the performance of cricket players in an organized and efficient manner.

The proposed application will maintain a centralized database where all player information and match statistics can be stored securely. Coaches or administrators can easily enter details such as player profiles, match results, batting performance, bowling statistics, and fielding records. The system will automatically calculate important performance metrics like batting average, strike rate, number of wickets, bowling economy rate, and other statistical values.

The application will include a user-friendly interface that allows users to quickly add, update, and view player performance data. It will also generate automated reports and graphical representations of player statistics. These reports will help coaches and team managers analyze the performance of players over different matches and training sessions.

Another important feature of the proposed solution is the performance comparison and historical data tracking. The system will store past records, allowing users to compare the performance of players across multiple matches or seasons. This will help in identifying performance trends, strengths, and areas that require improvement.

The application will also support data visualization features, such as charts and performance graphs, which make it easier to understand player progress. These visual reports can assist coaches in creating better training strategies and selecting players based on accurate data.

By implementing this digital system, the process of performance tracking will become faster, more accurate, and more reliable. It will reduce manual workload, eliminate calculation errors, and provide quick access to performance data. Players will also benefit by monitoring their own progress and focusing on improving specific skills.

WORK FLOW DIAGRAM

Data Flow Diagram

Data Flow

User → Salesforce UI → Player Object → Match Performance → Reports → Dashboard

User: The process begins with the end-user.

Salesforce UI: The user interacts with the system through a User Interface (UI), typically by logging in (indicated by the "Username" and "Sign" in screen) or inputting data into the system.

Player Object: The UI connects to the central "Player Object." Think of this as the main database entity or table storing the core profile of the athlete, including basic attributes like their Name, total Matches played, and overall Average.

Match Performance: Data then flows to specific match statistics. This represents related records detailing granular performance metrics for individual games, such as Runs scored, Wickets (Wkts) taken, and Catches made.

Reports: The raw performance data from those records is processed and compiled into analytical reports, summarizing the statistics into visual formats like the pie chart shown.

Dashboard: Finally, these reports feed into a higher-level Dashboard. This provides a consolidated, graphical overview of the data through various charts (bar charts, line graphs), making it easy to track and analyze overall performance trends at a glance.

SYSTEM ARCHITECTURE

Key Components

1. User Layer

- Players: Input fitness data, training attendance, and receive personalized feedback.
- Coaches: Enter match statistics, monitor training progress, and access performance reports.

2. Application Layer

- Data Entry Module: Interfaces for recording match statistics, training sessions, and fitness metrics.
- Validation Engine: Ensures accuracy of inputs
- Calculation Engine: Automated formula fields compute batting averages, strike rates, bowling economy, and fitness scores.
- Workflow Automation: Scheduled tasks trigger notifications, generate reports, and update dashboards.

3. Database Layer

- Player Profile Table: Stores personal details, career stats, and fitness records.
- Match Record Table: Logs batting, bowling, and fielding statistics for each match.
- Training Session Table: Tracks fitness drills, practice schedules, and progress.
- Performance Report Table: Consolidates calculated metrics for analysis and visualization.

4. Analytics Layer

- Reports Module: Generates detailed performance reports for individuals and teams.
- Dashboards Module: Provides interactive visualizations of batting form, bowling consistency, and fitness progress.
- Comparative Analysis: Enables side-by-side evaluation of players across formats (Test, ODI, T20).

5. Cloud Infrastructure

- Ensures secure data storage, scalability, and 24/7 accessibility.
- Supports integration with external devices (e.g., fitness trackers, video analysis tools).

SUMMARY

The **Cricket Player Performance Tracking Application** is developed to provide an efficient and organized system for recording and analyzing the performance of cricket players. In many cricket teams and academies, player statistics are often recorded manually, which can lead to errors, data loss, and difficulty in analyzing performance over time. This application solves these problems by providing a digital platform to manage player information and match statistics in a structured way.

The system allows administrators or coaches to create player profiles and store important details such as player name, role, team information, and other personal data. After each match, the coach or admin can enter performance data including batting statistics like runs scored, balls faced, and strike rate, as well as bowling statistics such as overs bowled, wickets taken, and bowling economy rate. Fielding performance, including catches and run-outs, can also be recorded.

One of the important features of this application is the **automatic calculation of performance statistics**. Once the match data is entered, the system automatically calculates values such as batting average, strike rate, and bowling economy. This reduces manual calculations and improves the accuracy of the results. The application also stores all match and player performance records in a database, which helps maintain **historical performance data**. This data can be used to analyze player progress over time and compare performances across different matches. Coaches and team managers can use these insights to identify the strengths and weaknesses of players and design better training programs. Another important advantage of the system is the **generation of reports and graphical representations**. The application can display player performance through charts and reports, making it easier to understand and analyze the data. These visual reports help in decision-making related to player selection and team strategies.

SCREEN SHORTS

SING UP PAGE:

PLAYER FLOW:

TABS:

The screenshot shows the Salesforce Setup interface in Developer Edition. The left sidebar has a search bar with 'Tabs' entered and a list of navigation items including 'User Interface' and 'Rename Tabs and Labels'. The main content area is titled 'Custom Tabs' and includes a 'Help for this Page' link. Below the title, there is a descriptive paragraph about custom tabs. The interface is divided into three sections: 'Custom Object Tabs', 'Web Tabs', and 'Visualforce Tabs'. Each section has a 'New' button and a 'What is This?' link. The 'Custom Object Tabs' section contains a table with two rows of tabs.

Action	Label	Tab Style	Description
Edit Del	Match Performances	Computer	
Edit Del	Players	People	

The 'Web Tabs' and 'Visualforce Tabs' sections both indicate that no tabs have been defined.

HOME:

The screenshot shows the Salesforce Home page for a user named CRICKSTATS. The left sidebar has a search bar and a list of navigation items including 'Home', 'Players', 'Match Performances', 'Reports', and 'Dashboards'. The main content area is titled 'Player Flow' and features a 'Team' dropdown menu. The dropdown menu is open, showing a list of cricket teams including Chennai Super Kings (CSK), Delhi Capitals (DC), Kolkata Knight Riders (KKR), Mumbai Indians (MI), Punjab Kings (PBKS), Rajasthan Royals (RR), Royal Challengers Bangalore (RCB), Sunrisers Hyderabad (SRH), Gujarat Titans (GT), and Lucknow Super Giants (LSG).

CRICKET PLAYER LIST:

Profile Picture	Player Name	Total Runs	AVG Score	Batting Style	Bowling Style	Matches Played	Number of 50's	Number of 100's
	MS Dhoni	24	24	Right-Handed	Right-Arm Fast	1	0	0
	Ruturaj Gaikwad	68	68	Right-Handed	Right-Arm Fast	1	1	0

PLAYERS

The screenshot shows the 'Recently Viewed' section for 'Players' in the CRICKSTATS application. The page has a header with the CRICKSTATS logo, a search bar, and navigation links for Home, Players, Match Performances, Reports, and Dashboards. Below the header, there's a sub-header 'Players' with a 'Recently Viewed' dropdown and a list of 6 items. The list is titled 'Player Name' and contains the following entries:

	Player Name	
1	Hardik Pandya	
2	Rishabh Pant	
3	Virat Kohli	
4	KL Rahul	
5	MS Dhoni	
6	Ruturaj Gaikwad	

At the bottom of the page, there's a Windows taskbar showing the time as 10:08 on 07-03-2026.

MATCH PERFORMANCE :

The screenshot shows the 'Recently Viewed' section for 'Match Performances' in the CRICKSTATS application. The page has a header with the CRICKSTATS logo, a search bar, and navigation links for Home, Players, Match Performances, Reports, and Dashboards. Below the header, there's a sub-header 'Match Performances' with a 'Recently Viewed' dropdown and a list of 4 items. The list is titled 'Match Performance Name' and contains the following entries:

	Match Performance Name	
1	IPL - 2026 CSK-RCB	
2	IPL - 2026 CSK-GT	
3	IPL - 2026 DC-GT	
4	IPL - 2026 LSG-DC	

At the bottom of the page, there's a Windows taskbar showing the time as 10:09 on 07-03-2026.

PLAYERS REPORT

DASHBOARD:

CONCLUSION

The Cricket Player Performance Tracking Application is an effective solution for managing and analyzing cricket player performance using modern technology. In traditional systems, performance data is often recorded manually, which can lead to errors, data loss, and difficulty in analyzing player statistics over time. This project overcomes those limitations by providing a digital platform that organizes and stores player performance data in a systematic way.

The application allows administrators or coaches to maintain detailed player profiles and record match performance such as batting, bowling, and fielding statistics. The system automatically calculates important metrics like batting average, strike rate, total runs, wickets taken, and bowling economy rate. This helps reduce manual calculations and improves the accuracy and reliability of the data.

Another important advantage of the system is the ability to store and manage historical performance records. By maintaining data from multiple matches, the application helps users analyze long-term player performance and track improvement over time. Coaches and team managers can easily evaluate players and make better decisions related to team selection and training strategies.

The application also improves the efficiency of performance analysis by providing reports and graphical representations of player statistics. These reports help in understanding player performance trends and identifying areas that need improvement. Players themselves can review their statistics and work on developing their skills.

This project also demonstrates how technology and data management can support sports analytics. It provides valuable insights that can help teams achieve better results.

In the future, the system can be enhanced with additional features such as mobile application support, cloud-based data storage, real-time match updates, and advanced analytics using artificial intelligence. These improvements can make the system even more powerful and useful for professional cricket teams and sports academies.

In conclusion, the Cricket Player Performance Tracking Application successfully provides a structured and efficient way to monitor and evaluate cricket player performance. It helps coaches, players, and sports organizations improve training, decision-making, and overall team performance through accurate and data-driven analysis.
